

# Table management at your fingertips.

Table iQ® offers all of the convenience of the iPad® while providing a smart and powerful tool to manage your dining venue more effectively.

Now you can manage your dining room with the tip of your finger. Automatically take full advantage of your seating capacity and increase table turns while reducing table idle time.

**Timeline Manager** represents your dining room seating strategy to efficiently direct the flow of guests, assign tables and accommodate walk-in traffic.

Working with or without advanced reservations, our patent-pending Timeline Manager is constantly monitoring service period activity and making adjustments in table assignments in real time. It intelligently allocates tables and continuously adjusts service durations based on actual guest behavior.

When guests overstay, leave early or don't show, the Timeline Manager automatically adjusts upcoming table assignments to maximize table turns, while taking into consideration guest's seating requests, and evenly distributing covers across servers.

**Floor Plan.** Customized color floor plans and interactive table graphics can be sized and rotated to provide you with a visually appealing representation of your dining room.

Server stations are noted by colored borders, table status is represented by color changes, timers indicate service duration, and chairs illuminate to show the number of guests seated at a table.

Our Recommended Seating feature called the **Game Plan**, highlights and "jiggles" tables that meet guest criteria, factoring in capacity, seating requests and server rotation. So much more than a pretty picture!

**Wait List.** View at-a-glance information to assess and manage guest needs and requests for each service period, including reservation type, party size, arrival status, special occasion notes, table and/or server requests, along with arrived, quoted and paged times.

Working with or without advanced reservations, guests can be located, added or removed in real time. Send text messages when tables are ready for seating and eliminate those costly pagers.

**Parking Lot.** Table iQ places unallocated guests in a priority wait list called the Parking Lot until the flow of traffic can make accommodating them possible.

Guests in the Parking Lot are automatically updated as the Recommended Seating feature evaluates traffic flow and makes seating recommendations based on your prioritized seating parameters, all in an effort to "empty" the Parking Lot as quickly as possible.

**Service Pulse.** A unique analysis and reporting feature that provides real-time service details, including tables seated and actual seats occupied; the number of guests awaiting service, in service and serviced; actual turn rates, bus-to-clear times, table idle times, number of table turns; and current wait times for parties of two, four and six, all at a glance.

The **Server Ledger** gives you the data you need to manage wait staff, including server arrival times, active covers, active tables, total covers, total tables, and time last seated. No more guessing about server rotation, or which server to cut next. The intelligence behind Table iQ also tracks turn rates by server.
